NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Submitted (05-SEP-2001) Takuji Sasaki, National Institute of Agrobiological Sciences, Rice Genome Research Program; Kannondai 2-12, Tsukuba, Ibaraki 305-8602, Japan 12-12, Tsukuba, Ibaraki 305-8602, Japan (E-mail:tsasaki@idas.affrc.go.jp, URI:http://rgp.dna.affrc.go.jp/, Tel:81-298-38-7441, Fax:81-298-38-7468)

The nuclectide sequence of this BAC clone was generated by combining Monsanto and RGP-Japan sequencing data.

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

The nucleotide sequence of this BAC clone was generated by combining Monsauto and RGP-Japan sequencing data.

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

The nucleotide sequence of this BAC clone was generated by combining Monsanto and RGP-Japan sequencing data.

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* This sequence will be replaced as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                               ij
                                                                                                Also described is a marker for detection polymorphisms in plant genomes. The constructed marker can be used for detecting plant genome polymorphisms, which is useful particularly in studying restriction fragment length polymorphism applicable in cell genetics e.g. for analysing and selecting specific breeds of plants. The method is simple, easy, less time consuming and not so laborious, e.g. in the study of less frequently occurring polymorphism between various species to enable identification of the site and isolation of the required gene.

ABLA9926 to ABLSO036 represent nucleotide sequences used in the exemplification of the present invention.
                                                           detecting polymorphisms in a plant genome. The method comprises the production of a primer for nucleic acid amplification by using the base sequences of a transposable element and/or the domain adjacent to it.
                                                  present invention describes a method for constructing a marker for

detecting polymorphisms in a plant genome. The method comprises the production of a primer for nucleic acid amplification by using the base sequences of a transposable element and/or the domain adjacent to it. Also described is a marker for detection polymorphisms in plant genomes. The constructed marker can be used for detecting plant genome polymorphisms, which is useful particularly in studying restriction fragment length polymorphism applicable in cell genetics e.g. for analysing and selecting specific breeds of plants. The method is simple, easy, less time consuming and not so laborious, e.g. in the study of less frequently occurring polymorphism between various species to enable identification of the site and isolation of the required gene.

ABL49926 to ABL50036 represent nucleotide sequences used in the exemplification of the present invention.
                                                   Construction of marker for detecting plant genome polymorphism with use of transposable element, useful particularly in studying restriction fragment length polymorphism applicable in cell genetics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for constructing a marker for

The present invention describes a method for constructing a marker for detecting polymorphisms in a plant genome. The method comprises the production of a primer for nucleic acid amplification by using the base sequences of a transposable element and/or the domain adjacent to it.

Also described is a marker for detection polymorphisms in plant genomes. The constructed marker can be used for detecting plant genome.

The constructed marker can be used for detecting plant genome polymorphisms, which is useful particularly in studying restriction ranging and selecting specific breeds of plants. The method is simple, easy, less time consuming and not so laborious, e.g. in the study of less frequently occurring polymorphism between various species to enable identification of the site and isolation of the required gene.

Abidagoze to AbiSol036 represent invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a disease resistance protein of rice variety Tsuyuake. The rice Pi-ta gene was cloned by a map-based cloning strategy. The Pi-ta protein has a novel structure, compared to all known classes of resistance gene products. The Polynucleotide sequence confers a Pi-ta resistance gene-mediated defence response against diseases caused by fungal pathogens, particularly the rice blast fungus. Introduction of the cloned Pi-ta gene into susceptible rice confers resistance to pathogen strains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2.7%; Score 137.4; DB 21; Length 5113; 85.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes a disease resistance protein of rice variety Yashiro-mochi. The rice Pi-ta gene was cloned by a map-based cloning strategy. The Pi-ta protein has a novel structure, compared to all known classes of resistance gene products. The polynucleotide sequence confers a Pi-ta resistance gene-mediated defence response against diseases caused by fingal parthogens, parthcularly the rice blast fungus. Introduction of the cloned Pi-ta gene into susceptible rice confers resistance to pathogen strains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2; Gaps

The invention relates to an Arabidopsis thaliana nucleic acid (I)

Comprising a sequence capable of hybridising under stringent conditions
to a sequence schecked from any one of 999 sequences (ARM93231),
Given in the specification or its fragment. A polypeptide (II) encoded by
Given in the specification or its fragment. A polypeptide (II) encoded by
Given in the specification or its fragment. A polypeptide (II) encoded by
Given in the specification or its fragment. A polypeptide (II) is
genetically modified cell (IV) comprising an exogenous nucleic acid or a
genetically modified cell (IV) comprising an exogenous nucleic acid, is
useful for screening a candidate agent for its biological effect. (I) is
useful in identifying homologous or related genes, in producing
compositions that modulate the expression or function of its encoded
protein, mapping functional regions of the protein and in studying
compositions that modulate the expression or function
associated physiological pathways. (I) is also useful in studying
composition of cells, particularly plant cells. (I) is also useful in
screening assays of various plant strains to determine the strains that
care best capable of withstanding a particular disease or environmental
stress. (II) and (III) are useful in improved methods of treating
crops to prevent or treat disease. (II) are also useful in screening
crops to prevent or treat disease. (II) are also useful in screening
crops to prevent or treat disease. (II) are also useful in screening
crops to prevent or treat disease. (II) are also useful in screening
crops to prevent or treat disease. (II) are also useful in screening
crops to prevent or treat disease. (II) are also useful in screening
crops to prevent or treat disease. (II) are also useful in screening
crops to prevent or inhibiting production of a biosynthetic product in a
plant. (III) is useful in for identifying other mediators that may indect the biological innotion of the genetic function and regulation,
colerance to environmental stress, for ide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1422
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1476

and protein sequences isolated from encalyptus (Eucalyptus grandis) or pine (Pinus radiata also known as Monterey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and development of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and nutrient metabolism. Examples of modifications which can be produced altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                senescence of reproductive organs to engineer sterile plants. Other modifications can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in forest tree species giving long stretches of valuable knot-free clear wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eucalyptus grandis; Pinus radiata; Monterey pine; plant; modification; plant cell signalling; modulation; transgenic plant; pathogen; growth, environmental change; development; cell proliferation; differentiation; elongation; survival; disease resistance; nutrient metabolism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated polynucleotide encoding a polypeptide involved in cell signaling used for generating transgenic plants with modified responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide

```
The invention relates to an isolated hypoxia inducible promoter (HIP) obtained from the pyruvate decarboxylase (PDC) gene in rice. The HIP can be used for regulating the expression of foreign genes in cells such that the genes are expressed upon exposure of the cells to anaerobic conditions. The HIP can be used to produce transgenic plants that are more tolerant of anaerobic conditions, e.g. flooding. The HIP can also be used to enhance the expression of gene products that are normally induced under hypoxia conditions. The promoter can be operably linked to genes that express a protein product that is effective against solid tumours sequence obtained from rice pdc2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                         4381 GCTATAAACCAGCTATAAACATATTTTAAAGAGATAAAAGAAGAGGAGAATAGCAGCGG 4440

be used for regulating the expression of foreign genes in rice. The HIP can be used for regulating the expression of foreign genes in cells such that the genes are expressed upon exposure of the cells to anaerobic conditions. The HIP can be used to produce transgenic plants that are more tolerant of anaerobic conditions, e.g. ifooding. The HIP can also be used to enhance the expression of gene products that are normally induced under hypoxia conditions. The promoter can be operably linked to genes that express a protein product that is effective against solid tumours pdc2 gene sequence.

The invention relates to a polynucleotide isolated from chromosome 11 of Indica rice cultivar CO39, flanked by marker R2316 and RG1094 comprising one or more genes that confer resistance to strains of Magnaporthe grisea having avirulence gene ANRI-CO39. The Pi-CO39(t) polynucleotides are useful for conferring or improving resistance of plants to strains of the rice blast pathogen, Magnaporthe grisea and other pathogens. The Pi-CO39(t) nucleic acids may be used as probes to detect the presence of and/or expression of Pi-CO39(t) genes, and to produce large quantities of pure Pi-CO39(t) proteins. Purified gene products of Pi-CO39(t) are useful in producing polyclonal or monoclonal antibodies useful as sensitive detection reagents for the presence and accumulation of Pi-CO39(t).

                                                                                                                                                                                                                                                             polypeptides. The transgenic plants are useful for plant breeding or directly in agricultural or horticultural applications. The present directly is rice RGA38 contig.26Nippon DNA. This sequence comprises portion of BAC clone 82NO3 from Nipponbare, containing RGA38 sequence well as ores NBR5 and NBR6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                    for 48 hr. The tissue, total RNA, and poly(A) FNA were prepared, a cDNA library was made, and the cDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors).

Five-day old seedling shoots were then harvested, total RNA was prepared, polyfich RNA was purfied, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(·) cDNA phagemids. These steps were performed in the fu Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University of California, Riverside (Choi, Close, Fenton). Phagemids were performed at CUGI (Ming, Tu, Frisch, Henry, Simmons, Oates Performed at CUGI (Ming, Tu, Frisch, Henry, Simmons, Oates Kambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δŽ
                                                                                                            and subtropies, rely on rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mpp (Arumuganathan haploid genome equivalent of 431 Mpp (Arumuganathan haploid genome equivalent of 431 Mpp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety The of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AU097543 Linear EST 03-APR-2002 AU097543 Rice shoot Oryza sativa (japonica cultivar-group) cDNA close 85064, mRNA sequence.

RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site www.zmdb.lastate.edu and follow the links for
RescueMu.' Grid I was grown at Berkeley in 2001. DNA was
extracted from leaf punches, double digested using BamHI
and BglII, and ligated to form circular plasmids. DH10B
cells were transformed and then screened on LB plates with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BE443619 613 bp mRNA linear EST 25-JUL-2000 WHEIL16_B08_D16ZS Wheat etiolated seedling root normalized cDNA library Triticum aestivum cDNA clone WHEIL16_B08_D16, mRNA

Anote="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2: Moli, plants were grown at Washington State University, Pullman, WA in a greenhouse, the rachiese were excised and frozen in liquid nitrogen (Kleinhofs lab). In the TJ Close lab at the University of California, Riverside total RNA was prepared, poly(A) was purified, one primary unamplified colm library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis were serformed at CGI sequence analysis are setting and sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'n

pBluescript SK; Site_1 EcoRI; Site_2: KhoI; Seeds were
surface-sterilized germinated and grown aseptically in
the dark at room temperature on filter paper with water,
nystatin and cefotaxine in covered crystallization
dishes. Roots were harvested. The tissue, total RNA, and
poly(A) RNA were prepared, a cDNA library was made in the
TJ Close lab (Ghoi, Close, Fenton) at the University of
California, Riverside. The CDNA clones were in vivo

The CDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech Universisty. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

Half of the world population especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 431 Mbp (Arumuganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of

```
order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa. Nipponbare variety. The library contains 36,864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."
